Care on ecological basis of human life = biodiversity

Definitions of biodiversity

- **The variability of living organisms inhabiting all environments and the variability of the ecological systems of which these organisms are a part, whereby variability so defined includes intra-species diversity, interspecies diversity and ecosystem diversity (Convention on Biological Diversity, ‘Earth Summit’, Rio de Janeiro, 1992).**
- **The abundance of life forms found on Earth, the diversity of species, intra-species genetic variability, and the variety of multi-species natural systems, i.e. ecosystems and landscapes (Sienkiewicz 2010)**

What is biodiversity?

Difference in trophic position and resource use between con-specific Carabidae: isotopic study of seven common ground beetles on lake islands

Marcin ZALEWSKI^{1,6}, Dorota DUDEK¹, Jean-François GODEAU¹, Alexei TIUNOV², Krzysztof KUJAWA³, Paweł SIENKIEWICZ⁴, Werner ULRICH⁵

^{1,6}Centre for Ecological Research Polish Academy of Sciences, Łomianki, Poland, e-mail: zlewek@yahoo.com; ²Institute of Ecology and Evolution, Russian Academy of Sciences, Moscow, Russia; ³Research Centre for Agricultural and Forest Environment, Polish Academy of Sciences, Kościan, Poland; ⁴Department of Entomology and Environmental Protection, Poznań University of Life Sciences, Poznań, Poland; ⁵Nicolaus Copernicus University, Toruń, Poland, ⁶Museum and Institute of Zoology, Polish Academy of Sciences, Warsaw, Poland.

AIM: Ground beetles are commonly considered as generalist predators. However, scale and the meaning of trophic generalism is not well established in this model taxon. Here we study the trophic positions of seven common European species.

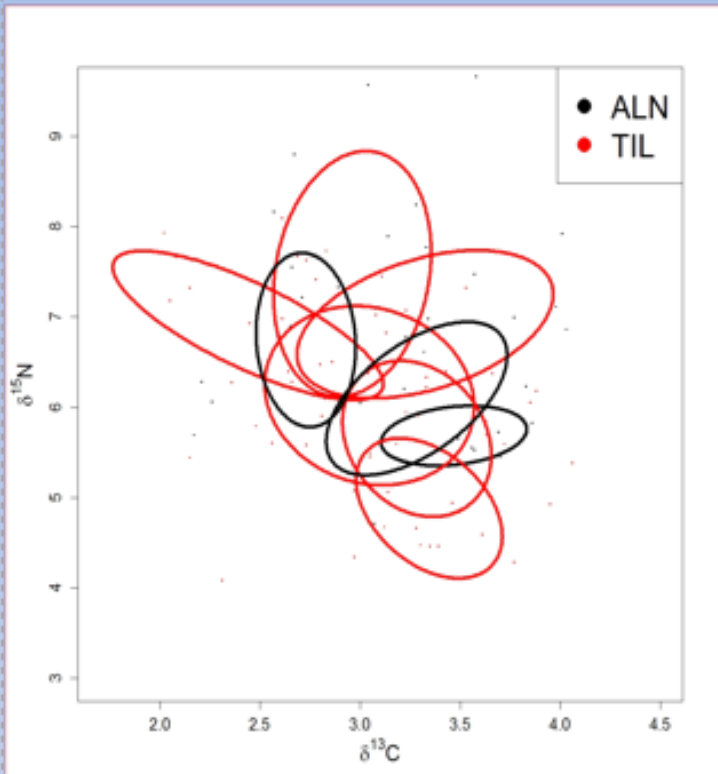

Fig. 2. The variability of isotopic trophic niche space of *Carabus granulatus*. Eigenvalue ellipses of isotopic niche space on different islands dominated by *Alnus* (ALN) and *Tilia* (TIL) (Zalewski et al. 2014).

METHOD:

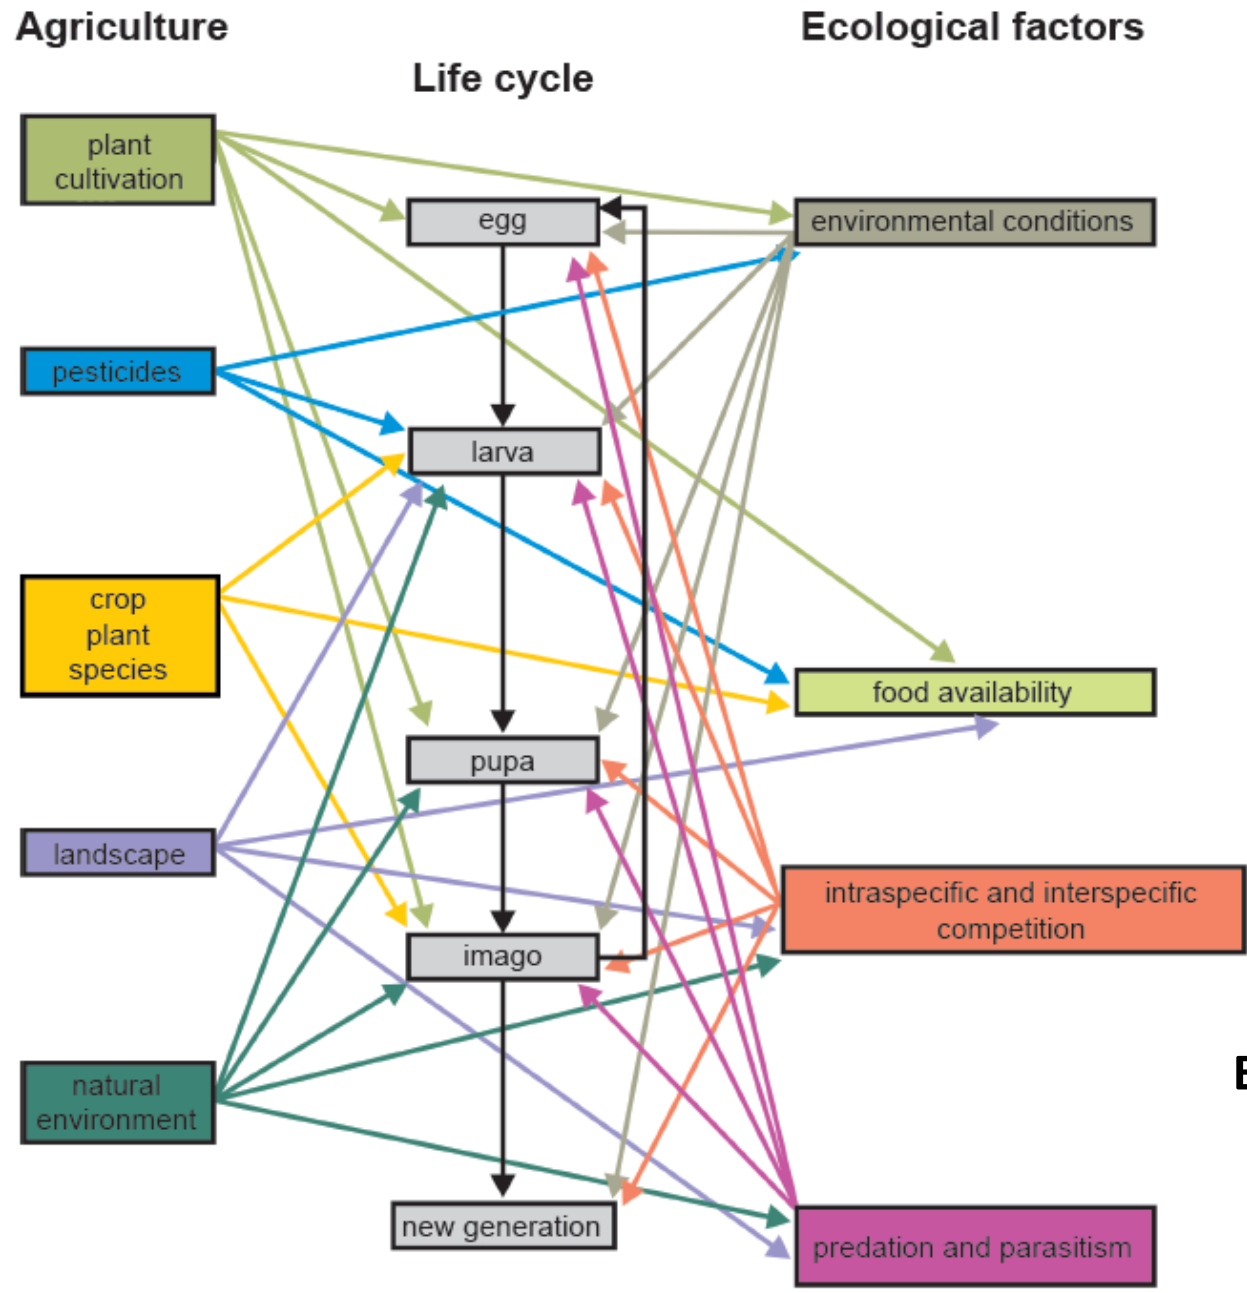

Litter baseline corrected stable isotope ratios ($\delta^{13}\text{C}$ and $\delta^{15}\text{N}$) were measured for 561 beetles of seven species inhabiting two types of habitat: Alder (ALN) and Lime-Oak

CONCLUSION:

Whereas we expected differences in trophic niches between habitats our results point to local trophic opportunism in common ground beetle species as expressed by isotopic differences between the lake islands of our study. Our results support literature claims that these species can make use of a wide variety of food resources in dependence of local food availability (e. g. Fig 2).

Zalewski, M., Dudek, D., Tiunov, A. V., Godeau, J.-F., Okuzaki, Y., Ikeda, H., Sienkiewicz P. & Ulrich W. (2014): High niche overlap in the stable isotope space of ground beetles. *Ann. Zool. Fennici* 51: 301–312;

Ecological and anthropogenic factors influencing the life cycle of ground beetles present in arable fields. (According to Holland 2002, modified)

Ground beetles (Carabidae) are voracious slug predators. Slugs transmitted neonicotinoid insecticides, impairing or killing >60% of ground beetles. Photo by Stewart Taylor.

Decline in pollinating insects in Britain

- Widespread species of wild bee and hoverflies
- Widespread southern species of wild bees and hoverflies
- Wild bees and hoverflies living in southern areas
- Wild bees and hoverflies living in upland areas

Occupancy is an estimate of the proportion of 1km grid cells where the species is present

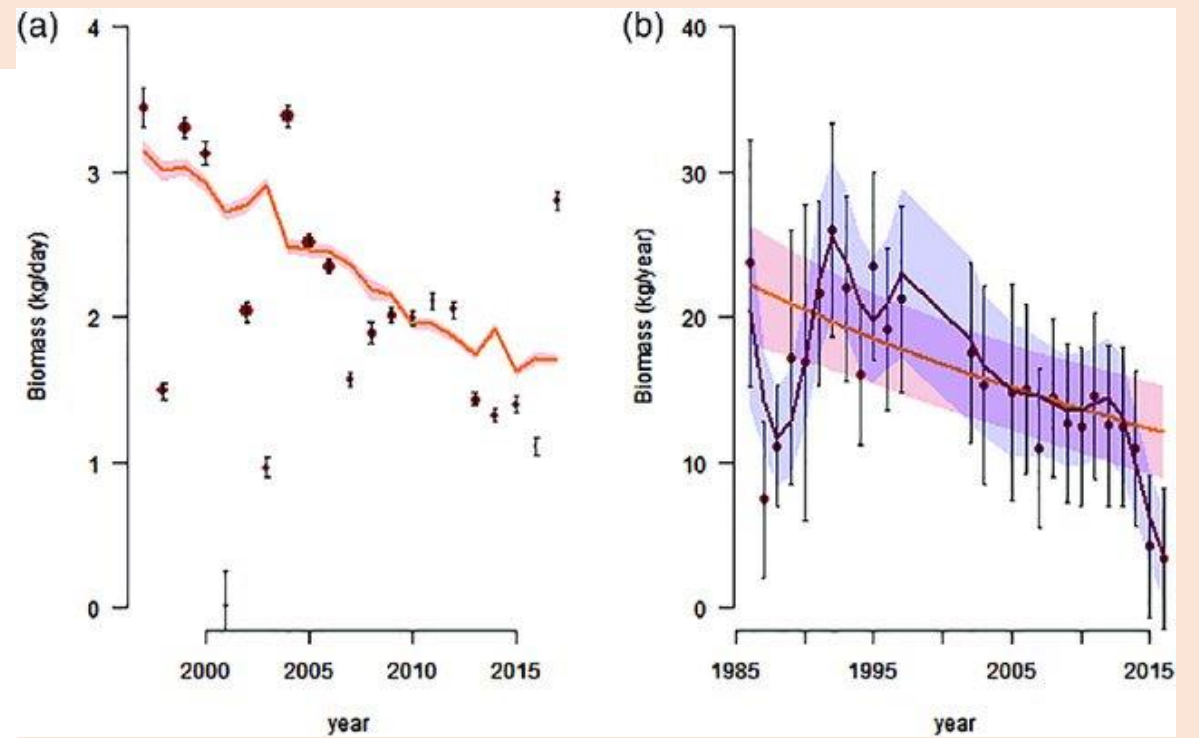

Fig. 5. Biomass trend of (a) macro-moths (Lepidoptera) per trapping night at De Kaaistoep and (b) ground beetles (Coleoptera: Carabidae) per year from pitfalls near Wijster. For each order, the annual indices (points), and estimates of the linear (orange) and non-linear (blue,) trends are given. Evidence for non-linearity is only apparent in Ground beetles, while for the remainder of the macro-moths the estimated trends of the two species are indistinguishable.

What we have collected in the rye crop and in the flower strips?

- 15239 specimens
- 75 species!!!

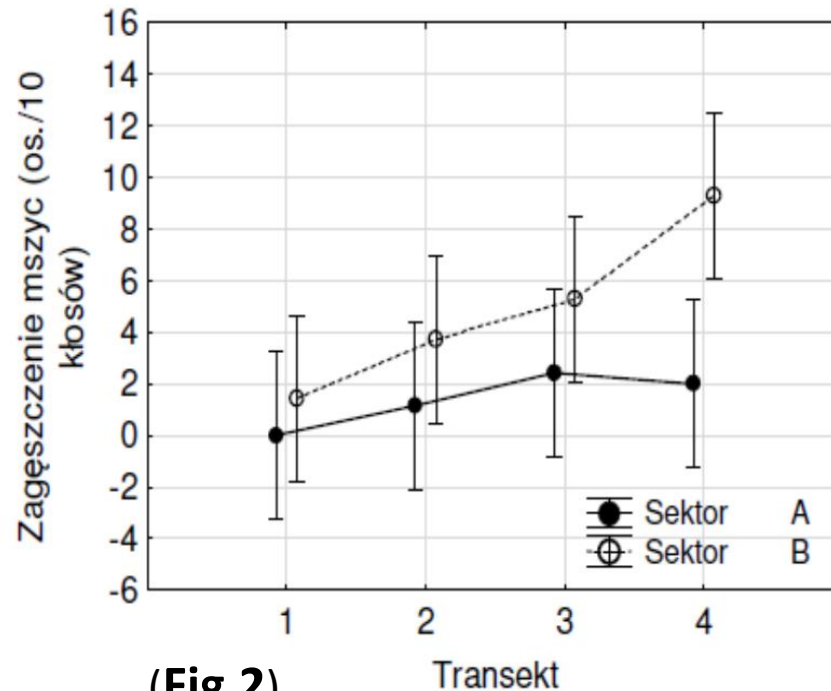

RESULTS - scarce hope?

- The average total density of pest insects was related to distance from the flower strips, increasing from about 3 individuals/plant near the strips to an average of 7 away from the strips (Fig.1).
- This was also true for the aphids themselves (Fig.2) The repetition of this pattern in both sectors (A and B) suggests the existence of a mechanism to reduce the density of pest insects near the flower strips.

(Fig.1)

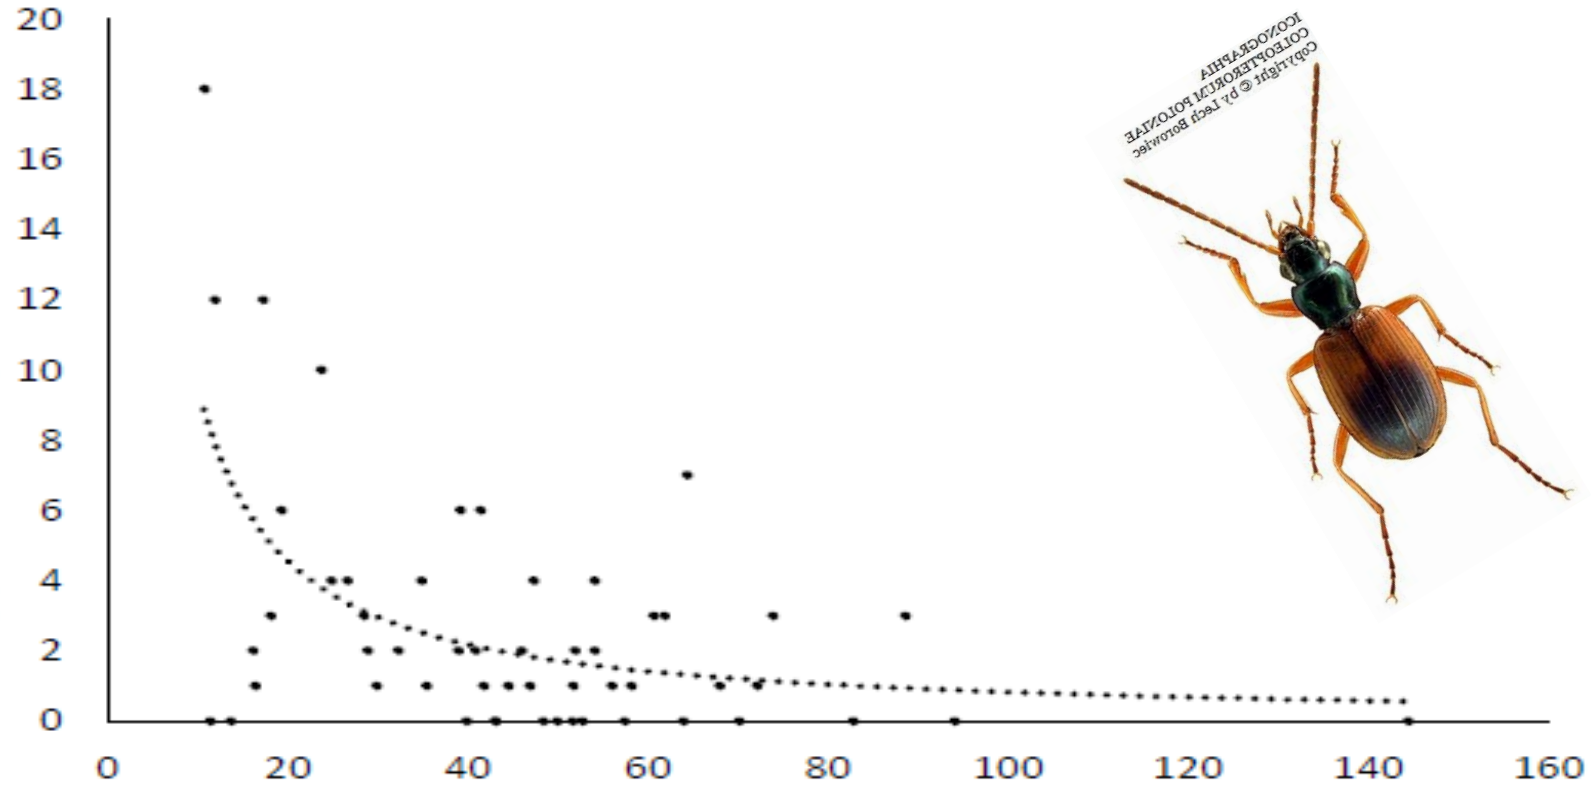

(Fig.2)

A strong indication of a reduction in aphid abundance by predatory insects and spiders is the strong ($r=0.58$), highly statistically significant ($P<0.001$) relationship between aphid density and the index of the combined density of predatory insects (runners and others) and spiders. Thus, a mechanism of lowering aphid densities due to the presence of flower strips by maintaining high densities of predatory invertebrates near the strips is likely.

Bringing diversity back to agriculture: Smaller fields and non-crop elements enhance biodiversity in intensively managed arable farmlands

Martin Šálek^{a,b,*}, Vladimír Hula^c, Marina Kipson^d, Renata Daňková^c, Jana Niedobová^c, Anna Gamero^d

Significant effects of large-spatial-scale percentage of non-cropped elements on (a) spider abundance, (b) butterfly abundance, (c) bird species richness and (d) butterfly species richness. Dots represent the raw data, lines represent the model predictions based on the corresponding estimates of main effects of the GLMMs presented in Table 2, and bands represent the 95% confidence intervals.

<https://conservationbytes.com/2015/10/09/to-spare-or-to-share-that-is-a-muddled-question/> - To spare or to share, that is a muddled question

that would confirm this. There were no human tests that would confirm such pro-health properties of goldenrod honey.

“So far, it has not been proven that goldenrod honey cures any diseases.”

GOLDENROD HONEY - UNHEALTHY FOR NATURE

She added that beekeepers, online stores or even some medical portals increase the demand for goldenrod honey by repeating this unverified information. This, in turn, has an indirect impact on the environment. Goldenrod, from which honey is produced, is a highly invasive plant in Europe, and its impact on biodiversity is definitely unfavourable.

Dr. Lenda said: “Beekeepers should know that goldenrod is not a plant they want. And consumers should be aware that buying goldenrod honey is bad for the environment.

“Nobody has shown before that dietary preferences, marketing of the so-called superfoods and pseudo-medicinal foods, can adversely affect the environment.”

Goldenrod honey harms environment and agriculture, say scientists
